

# Evidence maps: Informing research and practice

T Young

Centre for Evidence-based Health Care, Division of  
Epidemiology and Biostatistics, Stellenbosch University.  
Cochrane South Africa, South African Medical Research  
Council.

# Many factors influence decisions about health care

Burden of disease

Resource constraints

Level of care

Acceptability

Preferences/values

Politics

Evidence is necessary but not sufficient

# Research synthesis is an important approach to find answers

- ‘Research synthesis is the process through which two or more research studies are assessed with the objective of summarizing the evidence relating to a particular question.’
- ‘The results of a particular research study cannot be interpreted with any confidence unless it has been considered together with the results of other studies addressing the same or similar questions.’

Iain Chalmers

# A typology of reviews: an analysis of 14 review types and associated methodologies

Maria J. Grant\* & Andrew Booth†, \*Salford Centre for Nursing, Midwifery and Collaborative Research (SCNMCR), University of Salford, Salford, UK, †School of Health and Related Research (SchARR), University of Sheffield, Sheffield, UK

Table 1 Continued

Label	Description	Methods used (SALSA)			
		Search	Appraisal	Synthesis	Analysis
Rapid review	Assessment of what is already known about a policy or practice issue, by using systematic review methods to search and critically appraise existing research	Completeness of searching determined by time constraints	Time-limited formal quality assessment	Typically narrative and tabular	Quantities of literature and overall quality/direction of effect of literature
Scoping review	Preliminary assessment of potential size and scope of available research literature. Aims to identify nature and extent of research evidence (usually including ongoing research)	Completeness of searching determined by time/scope constraints. May include research in progress	No formal quality assessment	Typically tabular with some narrative commentary	Characterizes quantity and quality of literature, perhaps by study design and other key features. Attempts to specify a viable review
State-of-the-art review	Tend to address more current matters in contrast to other combined retrospective and current approaches. May offer new perspectives on issue or point out area for further research	Aims for comprehensive searching of current literature	No formal quality assessment	Typically narrative, may have tabular accompaniment	Current state of knowledge and priorities for future investigation and research
Systematic review	Seeks to systematically search for, appraise and synthesis research evidence, often adhering to guidelines on the conduct of a review	Aims for exhaustive, comprehensive searching	Quality assessment may determine inclusion/exclusion	Typically narrative with tabular accompaniment	What is known; recommendations for practice. What remains unknown; uncertainty around findings, recommendations for future research
Systematic search and review	Combines strengths of critical review with a comprehensive search process. Typically addresses broad questions to produce 'best evidence synthesis'	Aims for exhaustive, comprehensive searching	May or may not include quality assessment	Minimal narrative, tabular summary of studies	What is known; recommendations for practice. Limitations
Systematized review	Attempt to include elements of systematic review process while stopping short of systematic review. Typically conducted as postgraduate student assignment	May or may not include comprehensive searching	May or may not include quality assessment	Typically narrative with tabular accompaniment	What is known; uncertainty around findings; limitations of methodology
Umbrella review	Specifically refers to review compiling evidence from multiple reviews into one accessible and usable document. Focuses on broad condition or problem for which there are competing interventions and highlights reviews that address these interventions and their results	Identification of component reviews, but no search for primary studies	Quality assessment of studies within component reviews and/or of reviews themselves	Graphical and tabular with narrative commentary	What is known; recommendations for practice. What remains unknown; recommendations for future research

# Evidence maps

- Evidence maps are aimed at identifying research gaps

Or

- Support evidence- informed policy making by displaying an overview of interventions and outcomes along a causal chain associated with those interventions.

# AN EXAMPLE -- 3ie SR8: Handwashing and sanitation promotion programs & behaviour change

Last two decades: approaches to promote WASH behaviour

E.g. community-based participatory approaches

E.g. marketing approaches

Not clear which of the approaches is most effective

# Project plan

**Phase 1: Overview of systematic reviews**

Phase 2: Systematic review:  
review of primary studies

Phase 3: Communication and  
dissemination

AIM:

- Identify existing systematic reviews and create evidence gap map
- Help prioritizing research questions for Phase 2 of the project
- Use information in Theory of Change

# Selection criteria review of reviews (phase 1)

## Population:

- **low- and middle-income countries**
- **individual, household, community level or school settings**

## Interventions:

- **WASH interventions:** water supply, water treatment, water storage, latrine use, sewer connection, drainage system, hand hygiene, faeces disposal practices.
- **Promotional approaches:** education, communication, social marketing principles, financial incentives, community-led total sanitation or any combination of these approaches.

## Outcomes (EFFECTIVENESS):

- I. **Primary outcomes: behavior change outcomes**
- II. **Secondary outcomes: behavioral factors, health outcomes**

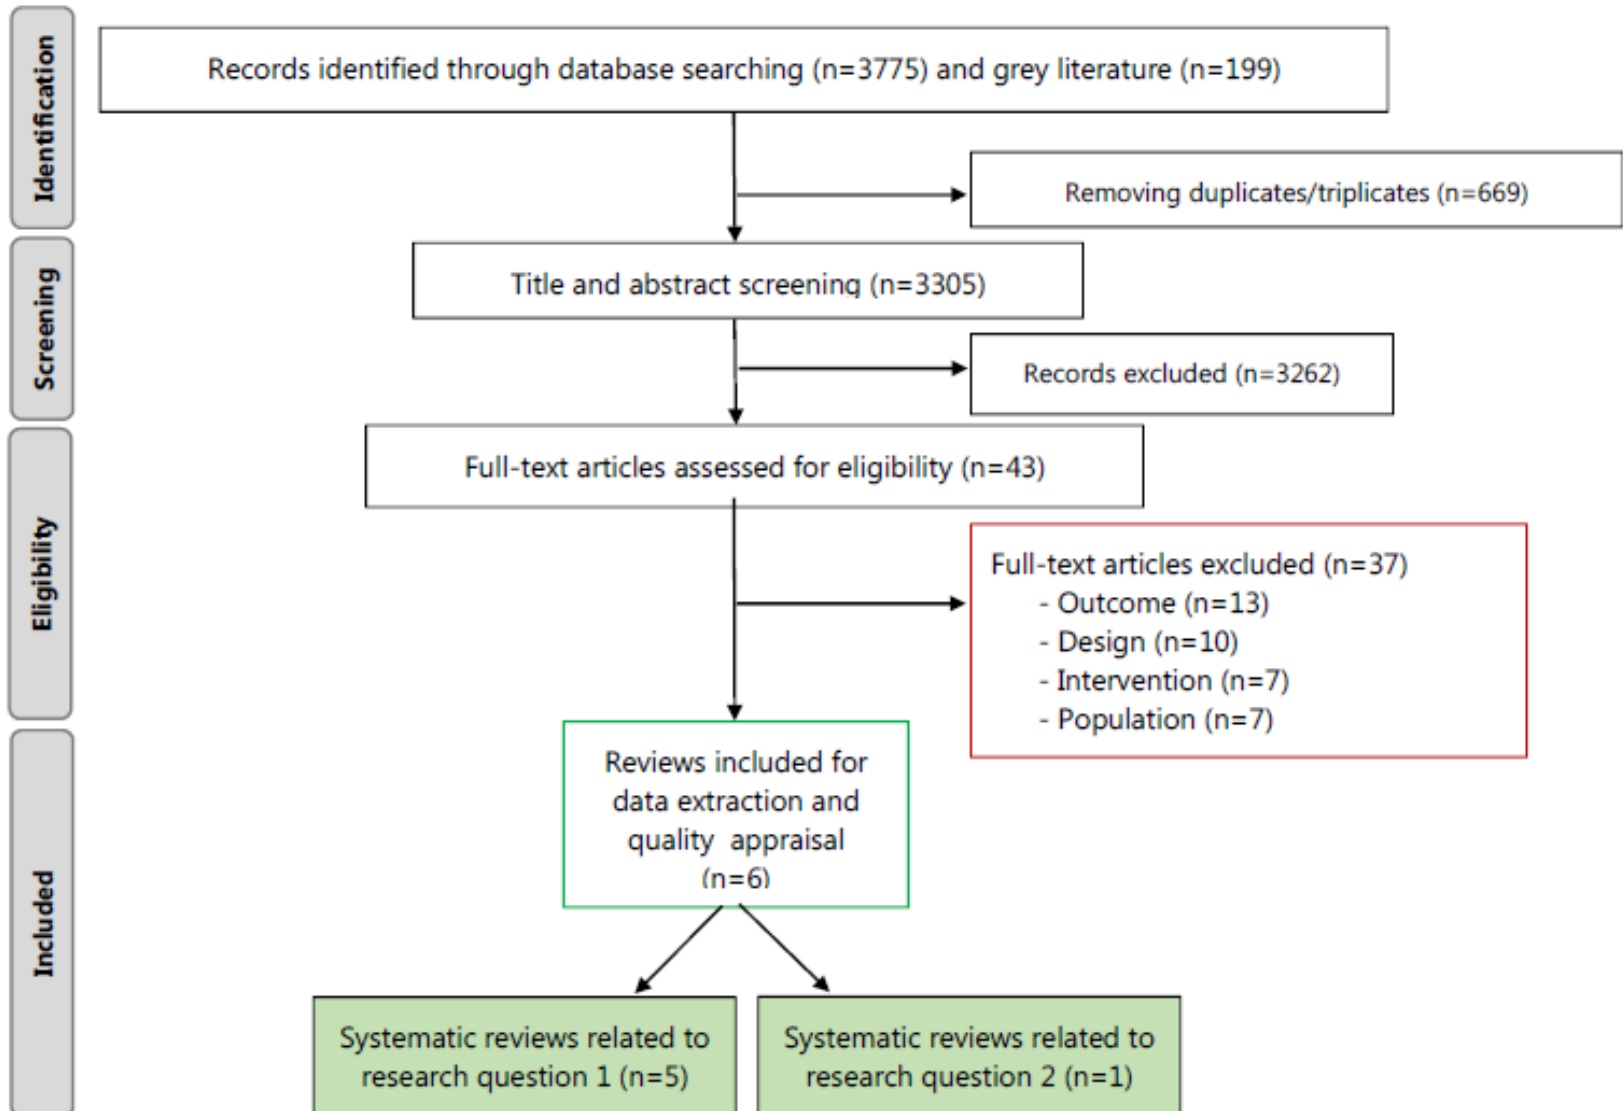

## Outcomes (IMPLEMENTATION):

- I. **Perceptions/experiences (applicability-appropriateness of the program) that can influence WASH behaviour change**

**Study design: systematic reviews** that (1) at least searched two electronic databases, (2) reported their search strategy and (3) reported their selection criteria.

# Results of the search process

# What is an evidence map?

- Synthesis
- Based on a systematic search
- To identify gaps in knowledge (thus identify future research needs) or summarise existing evidence
- Presents results in a user-friendly format, often a visual figure or graph, or a searchable database.

*Miake-Lye et al. Systematic Reviews (2016)*

# Typical presentation format

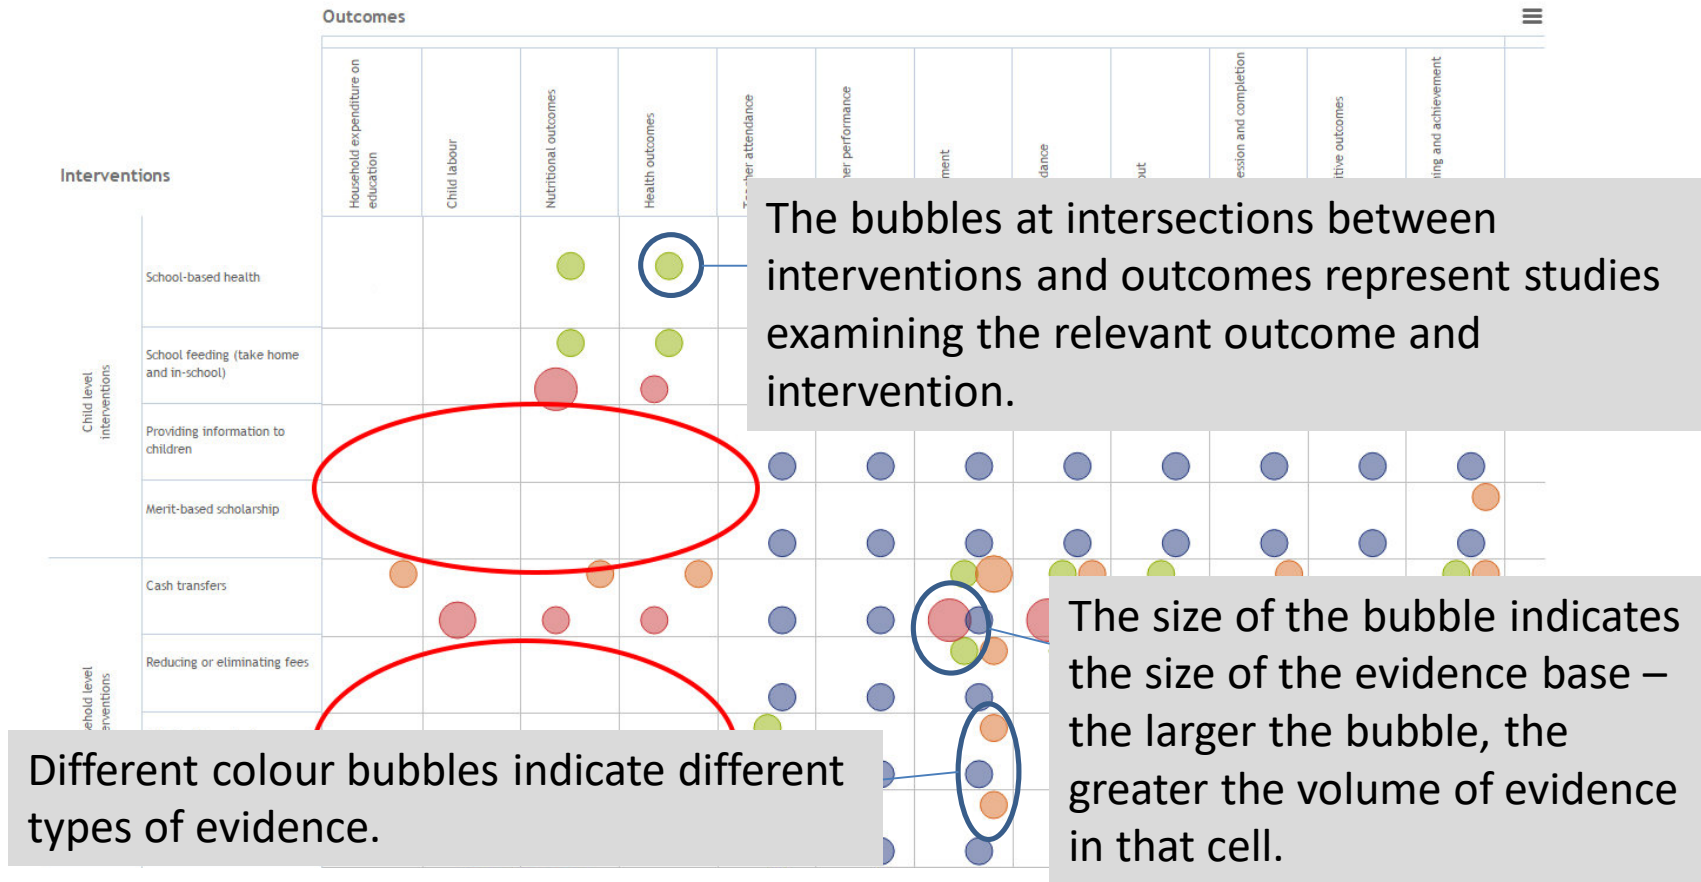

- It uses a matrix to plot interventions and outcomes in a theory-based model.
- It also uses bubbles and colours to indicate the quality of the evidence and the type of review, study or evaluation, and links to a database with summaries of the systematic reviews and impact evaluations.

# Approach to develop

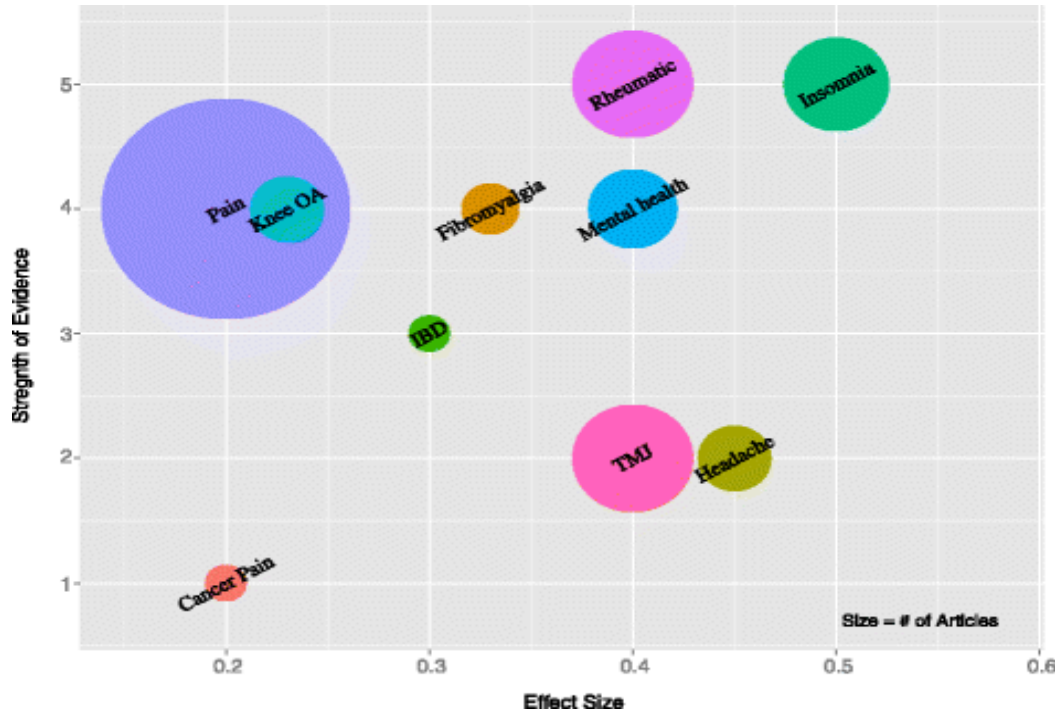

- Engagement and determine the question; time frame
- Decide on types of studies
- Conduct systematic searches of the literature
- Select studies
- Critical appraisal of included studies
- Extract information for the domains identified- e.g. intervention, outcomes, study design
- Collate and summarize studies
- Visually present the extracted data using cross-tabulation
- Engage stakeholders

# Screenshot of 3iE Evidence Gap Map on Development Evidence from existing systematic reviews

# Format of presentation

*Source: Taylor S et al. J Altern Complement Med. 2014;20(5);A91-2*

Evidence Map of acupuncture for pain. The bubble plot shows an estimate of the evidence base for pain-related indications judging from the systematic reviews and the recent large trials. The plot depicts the estimated number of RCTs (size of the bubble), the effect size (x-axis), and the strength of the evidence (y-axis)

# Uses

A <b>scoping tool</b> to set policy objectives and outline policy direction, background, and evaluation.	A <b>decision-making tool</b> to inform policy design and implementation.	An <b>engagement tool</b> to facilitate policy conversations with different actors from a mutual basis.	An <b>organisational tool</b> to raise awareness for evidence-based policy-making and to facilitate its process.
A <b>knowledge management tool</b> providing a repository of easily accessible and policy-relevant evidence tailored to decision makers' needs.	A <b>research tool</b> to identify gaps, coverage, and patterns in the available evidence on a policy question.	An <b>accountability tool</b> to record the evidence behind a decision and the construction of different evidence-bases and narratives for future decisions.	A <b>research commissioning tool</b> to target funding for new primary and secondary evidence.

## Policy Relevant Evidence Maps

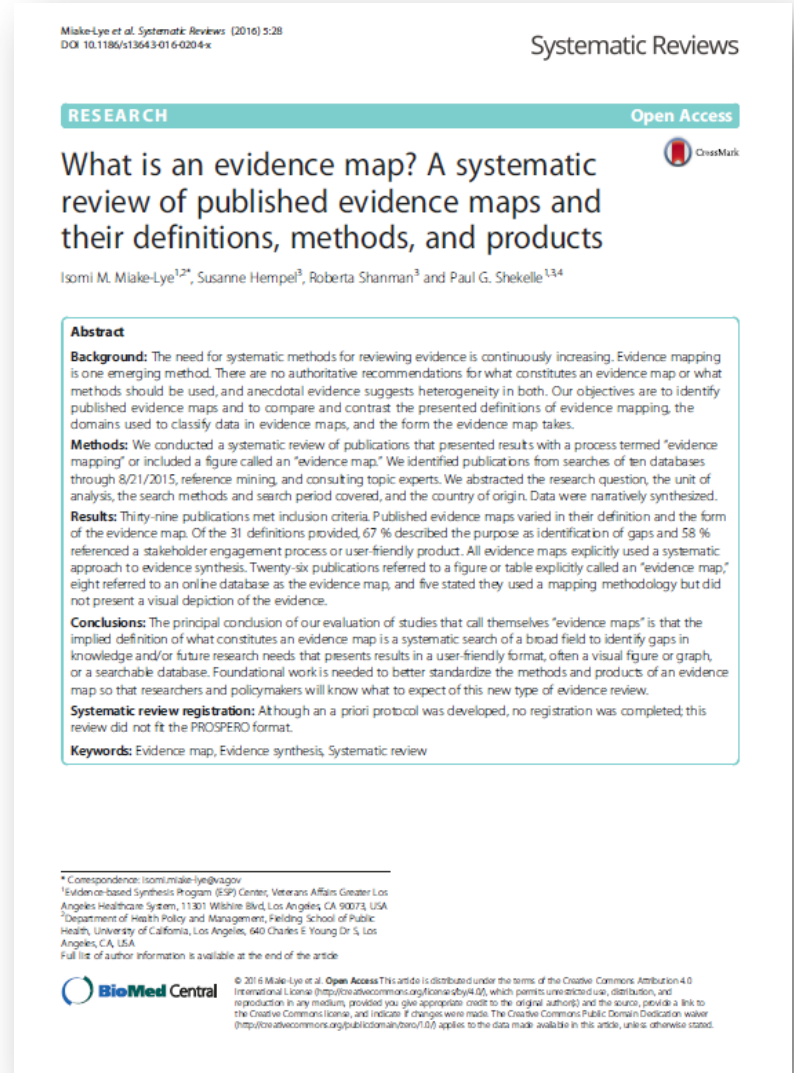

A departmental guidance note  
28 October 2016 Zero draft

*DPME*

# In summary: New and evolving field

- Collection of evidence
- May be part of a systematic review
- Evidence maps are typically broad in scope and address questions related to the size and characteristics of the evidence base, with the purpose of identifying existing research and research gaps (Haddaway et al. 2016; Miakel-Lye et al. 2016).
